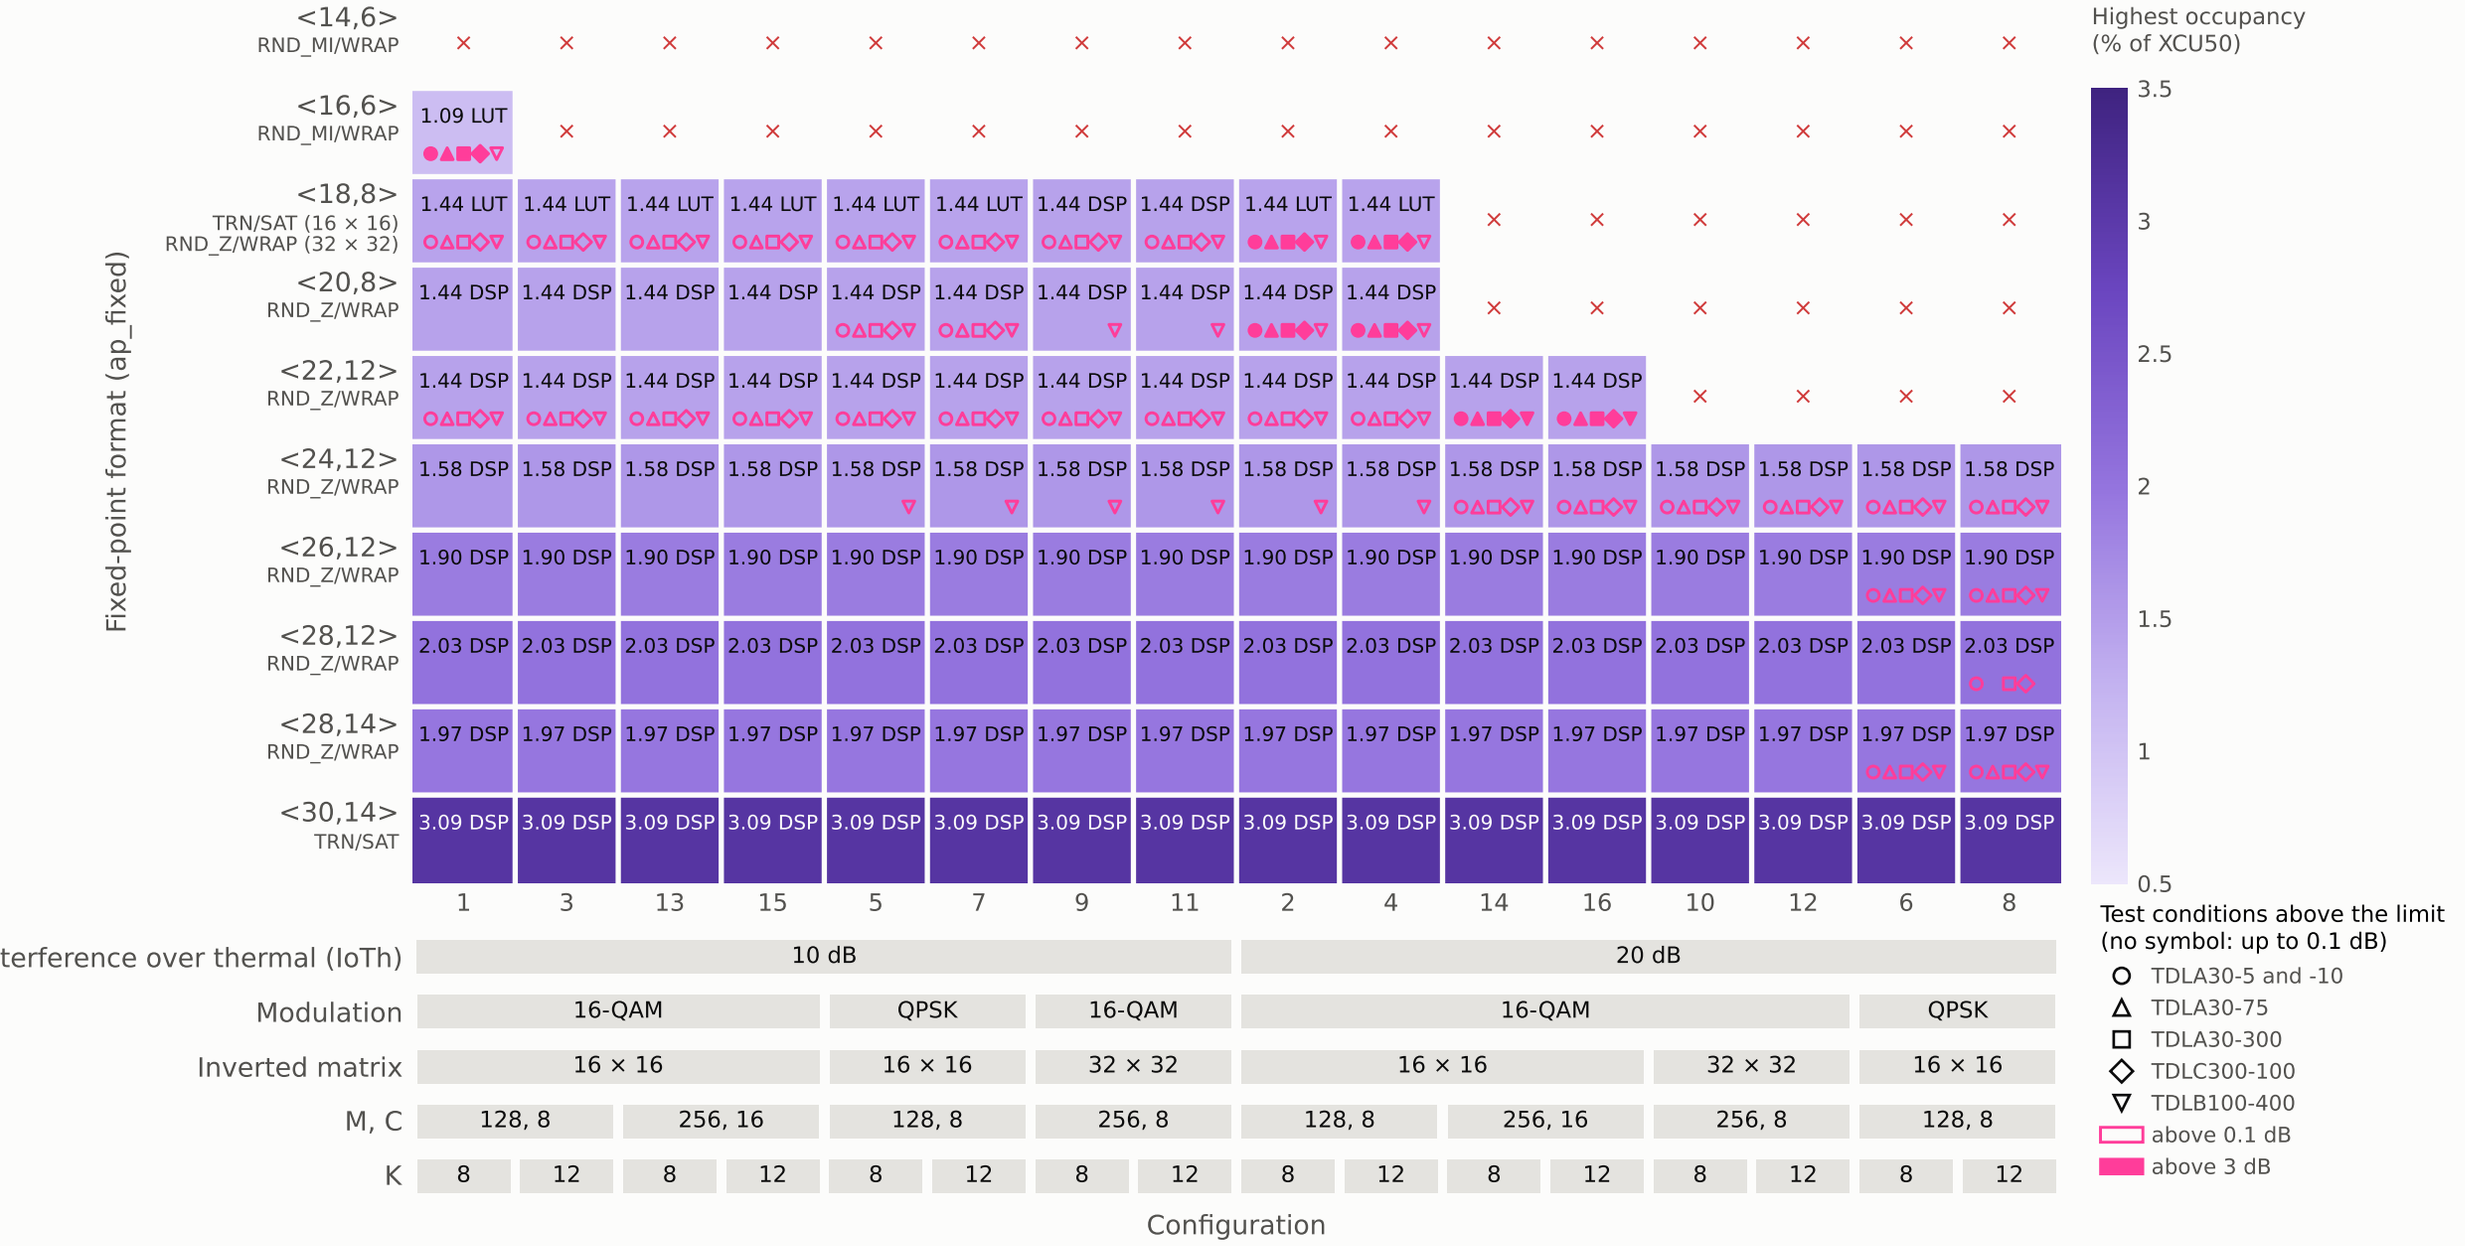
Highest XCU50 occupancy, fixed mode per format (BCD-MMSE, 4 iterations)



Occupancy: highest % of the XCU50 among LUT, DSP, FF and BRAM, and which resource (HLS synthesis 16 × 16; 32 × 32 in configurations 9 to 12).
Mode: one quantization and overflow mode per format (one for 16 × 16 and one for 32 × 32): the one within 0.1 dB in the most test conditions, summed over the configurations; ties go to the lowest occupancy.
×: in this mode, some test condition does not reach SER = 10^{-2} within the simulated SNRs, i.e. it needs more than 4 dB extra (the smallest margin between float64 and the highest simulated SNR).
